IMMUNIZATIONFAQs

HEPATITIS B

How long does it take to complete the Hepatitis B series?

After the first dose of Hepatitis B vaccine, antibody levels begin to rise. By the time of the second dose, antibody levels are usually high enough to provide protection. The immune system continues to produce antibodies after the second dose, reaching peak levels by the time of the third dose. It is important to follow the recommended vaccination schedule to ensure adequate protection.

What should I do if I am not immune based on my titer result?

If your hepatitis B titer is not sufficient, you may need to receive additional doses of the vaccine. Your healthcare provider will determine the appropriate course of action based on your individual circumstances. It is important to follow the recommended vaccination schedule to ensure adequate protection.
